Executive Summary – Joseph O'Connor

**Lab repo:** https://github.com/Joeyo364/add_Joey

Overview

There have been many contributions from 30+ developers over the lifetime of the project. Our analysis of git commits suggests that a few key people are contributing more to the project than a majority of those who have touched it. The number of developers contributing to the project has slowed down quite a bit in the last year, however the project is still being supported by these key contributors.

Contributors

Two of these key contributors are Scott Alexander Brown and Matthew Rollings, who combined have 102 commits to the project from the 159 in the master branch. Most other developers have a handful of commits, such as Andy Barber (3 commits) and Frieder Bluemle (7 commits). While the help from others has surely sped the development of the project along, it is the work of these key contributors that have made the project meet its deadlines.

Development Activity

Useful Commands

The command 'git log' has been useful to see the snapshots of the commit history. Another useful command is 'git clone <repo-link>' which allows the repository link to be cloned into a local directory, where a new branch can be created with the 'git branch <new-branch-name>' and development can proceed locally without affecting the master branch.
